Instrucciones para una correcta Instalación de filtros sellados.

Los filtros son las piezas que más seguido se sustituyen de su vehículo. Para asegurar el rendimiento normal del filtro, prevenir costosos daños a su motor y facilitar los próximos servicios, al reemplazar un filtro, siga los pasos que a continuación se describen:

El motor debe estar tibio, levante el cofre del motor de su vehículo y remueva el tapón de admisión de aceite.

Levante el vehículo tomando las medidas de seguridad apropiadas y desatornille el tapón del cárter o depósito, permita que escurra todo el aceite, vuelva a instalar el tapón del cárter no sin antes inspeccionar el estado de las juntas o empaques, reemplácelas si es necesario.

Remueva el filtro usado utilizando la herramienta apropiada, en algunos casos y dada la incomodidad de la instalación, se requerirá del uso de herramientas especiales que evitarán que el filtro se dañe, haciendo difícil su remoción.

Limpie con un trapo limpio la base del motor y asegúrese de que el empaque o junta anterior no se quede pegada a la base; no use estopa, aplique una película de aceite limpio al nuevo empaque. **Nota: Nunca use grasa lubricante en el empaque u otro material.**

Instale el nuevo filtro cuidando de no trasroscarlo. En las unidades grandes puede ser necesario llenar el filtro con aceite limpio antes de instalarlo, verifique las recomendaciones del manual del propietario, después de que el empaque del filtro tope con la base del motor, apriételo a mano de acuerdo a las instrucciones que se encuentran en el filtro o en el empaque del mismo producto

No sobre apriete, ni utilice herramientas para apretar.

Importante: Antes de efectuar cualquier cambio de aceite o filtros verifique que tenga las herramientas y conocimientos apropiados, de no tenerla visite a su centro de servicio o mecánico de confianza. Así evitará daños y demoras.

Baje el vehículo a nivel del suelo y llene el cárter o depósito con aceite limpio hasta el nivel recomendado, vuelva a instalar el tapón de admisión de aceite. Encienda el motor y espere unos segundos a que la presión se normalice. *Si el indicador de presión no indica la normalización o la luz de advertencia en el tablero no se apaga, apague el motor y revise la instalación*

Apague el motor y cheque el nivel de aceite, rellene si es necesario.

Encienda el motor por 5 minutos y verifique que no haya fugas alrededor del filtro, el tapón del cárter o depósitos y las conexiones existentes.

Apague el motor y cierre el cofre.

No tire el filtro usado y aceite sucio en el drenaje o en la tierra, observe las disposiciones ecológicas aplicables en su región.

Nunca deje encendida la unidad sin Vigilancia después de hacer un cambio De aceite o filtros, pueden presentarse fugas de lubricante sin percatarse de ellas, llegando a ser de resultados catastróficos.

Problemas con la luz de aviso para la presión de aceite.

La mayor parte de los automotores actuales utilizan una luz de aviso, montada en el panel de instrumentos para brindar al conductor una señal visual de la baja presión de aceite. La baja presión es importante, dado que el aceite "bajo presión" es necesario para separar adecuadamente las partes muy cargadas del motor y evitar un desgaste excesivo.

La luz de aviso está conectada en serie con un interruptor de presión de aceite, como se ilustra en la figura 1. El interruptor de presión contiene contactos eléctricos que están en posición cerrada cuando la presión de aceite es inferior a 5 lbs/pulg². Cuando el motor no está funcionando y el encendido está conectado a la luz de aviso queda conectada.

Cuando el motor es puesto en marcha, la presión de aceite comprime el diafragma en el interruptor de presión, abriendo los contactos y haciendo que la luz se apague.

Si la luz de aviso permanece conectada durante más de 5 segundos, después de que el motor ha sido puesto en marcha, apáguelo inmediatamente; el nivel de aceite deberá ser controlado y puesto en situación normal. Si la luz de aviso continua conectada cuando el nivel de aceite es normal, entonces podrá existir una serie de posibles problemas.

- 1.- El interruptor de presión puede haber fallado.
- 2.- El cableado entre el interruptor de presión y la luz de aviso puede estar conectado a tierra.
- 3.- La bomba puede estar descebada debido a una falla o a un filtro (o malla) de succión saturado.
- 4.- La válvula reguladora de presión puede estar abierta y retornar el aceite nuevamente al cárter.

En algunos motores, el filtro está montado en una posición que permite que el aceite drene nuevamente al cárter cuando el motor es detenido. Este sería el caso del filtro ilustrado en la figura 2, donde está en posición horizontal situado sobre el nivel de aceite en el cárter. Dado que el filtro acumula hasta 0.94 litros de aceite, toma aproximadamente cinco segundos para que la bomba lo llene después de que el motor ha sido puesto en marcha, durante cuyo lapso la luz de aviso queda conectada.

Para evitar que el motor funcione sin presión de aceite durante ese período, los filtros diseñados para esas posiciones contienen una válvula antidrenaje. Esta válvula tiene actualmente la forma de una empaquetadura de neopreno que permite el libre flujo de aceite a través del filtro en la dirección normal, pero cuando el motor está "parado" evita que el aceite se descargue en el cárter. Si la luz de aviso permanece conectada durante periodos más prolongados, después de que el filtro ha estado usándose en el automotor durante algún tiempo, se recomienda su reemplazo.

Bajo algunas condiciones, la luz de aviso puede parpadear cuando el motor está funcionando. Esto sucede generalmente cuando el vehículo está doblando o situado sobre una cuesta relativamente empinada. Si se produjese un parpadeo bajo estas condiciones, se debe a que el nivel de aceite es bajo, y el filtro (malla) de la bomba ya no está totalmente sumergido. El nivel de aceite debe ser inmediatamente llenado a la situación normal.

En síntesis, la luz de aviso de la presión de aceite brinda una Información vital al conductor. Si la luz permanece conectada o aún parpadea cuando el motor está funcionando, debe ser desconectada inmediatamente e Investigada la causa.

Pérdida de alimentación en la bomba de aceite.

Inmediatamente después de un cambio de aceite, uno de los asuntos que más confusión enfrentan los mecánicos profesionales o personas interesadas en hacer sus propias reparaciones, es la dificultad de recuperar la presión del aceite en la bomba a su nivel normal de operación.

Aunque no ocurre con frecuencia, es muy posible que la bomba de aceite pueda perder su alimentación o ceba durante el cambio de aceite.

Cuando se drena el aceite usado del motor (Fig. 1) puede también vaciarse el aceite del tubo de succión de la bomba de aceite y posiblemente de la bomba de aceite misma. Cuando se agrega el aceite nuevo al cárter, se ahoga de nuevo la entrada del tubo de succión, de la bomba de aceite sin lograr desplazar el aire atrapado en el tubo. El aire atrapado causará cavitación en la bomba, e impedirá el flujo de aceite y no habrá presión de aceite en el motor y sus indicadores.

Muchos instaladores al ver esto culpan de esta situación al filtro de aceite (Fig. 2) y suponen que el filtro está tapado a la vez bloqueando el flujo del aceite. Como el instalador sospecha del filtro, instalará un segundo filtro. A veces se resuelve así el problema porque el aire atrapado fue descargado cuando se retiró el primer filtro. Por lo tanto, se fortalece la sospecha del instalador de que el filtro era el causante de la falla argumentada.

El punto de todo esto es que el filtro de aceite no era problema y en muchos casos hay una solución sencilla.

Si después del cambio del filtro y de aceite, la luz roja o el indicador de presión baja del aceite continúa por diez segundos, apagar el motor, retirar el filtro de aceite (Fig. 3), y usando una pistola de aceite cargada con aceite de motor, inyectar aceite varias veces en la salida de la base del filtro de aceite en el motor (Esta será la abertura al lado del perno roscado; no ayudará en nada inyectar aceite en el perno roscado). Luego llenar el filtro con aceite de motor nuevo y reinstalar. Encender el motor y verificar si la presión de aceite se normaliza. En la mayoría de los casos el problema estará solucionado, sin embargo si la falla persiste, por ningún motivo se deberá permitir que el motor funcione por más de 10 segundos sin presión de aceite. Usar un reloj para cronometrar los diez segundos y estar seguro del lapso del tiempo. En ciertos casos, la bomba utilizará cada uno de los diez segundos para recuperar el flujo de aceite. Si esto falla de nuevo, retirar el filtro y encender el motor hasta que se derrame el aceite de la bancada del motor. No continúe encendiendo el motor por más de diez segundos a la vez. Cuando el aceite se derrame, reinstalar el filtro de aceite (Fig. 4), corregir el nivel del aceite y volver a encender el motor. La presión del aceite deberá volver a su nivel normal.

Nota: A veces se puede evitar este problema reduciendo el tiempo que drena el aceite.

Diferencias mas usuales provocadas por la válvula reguladora de presión.

Filtros para aceite lubricante con presión excesiva

Todos los fabricantes de filtros han recibido alguna vez un filtro devuelto por un cliente con una sobrepresión excesiva. Con frecuencia, el filtro deformado es la única indicación que tiene el dueño del automóvil para saber que se presentó un problema en su sistema de aceite lubricante.

Es posible que el filtro dañado no se haya advertido hasta que se quitó durante el siguiente cambio de aceite programado. Sin embargo, si la presión fue suficiente como para romper la junta o desenrollar la costura engargolada, el dueño del automóvil habrá experimentado problemas inmediatos y costosos.

Con la "evidencia" en sus manos, tiende a echarle la culpa al filtro dañado. No es sorprendente que él esté un poco más que molesto cuando el fabricante del filtro niega cualquier responsabilidad por el daño. Entonces, ¿Qué fue lo que causó la presión excesiva?. El echar una mirada a la forma como funciona el sistema de aceite lubricante, mostrará que la presión del aceite es creada por la bomba de aceite. El límite superior de esta presión está controlado por una válvula reguladora de presión que generalmente es una parte integral de la bomba.

La figura 1 es un diagrama simplificado del sistema de aceite lubricante, mostrando ésta bomba, válvula reguladora, filtro y rodamientos. La bomba suministra suficiente flujo para lubricar los rodamientos y otras partes móviles del motor. Este aceite debe estar bajo presión para separar adecuadamente las partes fuertemente cargadas del motor y evitar el desgaste excesivo. El objeto de la válvula reguladora es proporcionar esta presión que en la mayoría de los automóviles de pasajeros se encuentran entre los 40 y 60 PSI.

La válvula reguladora está formada por una bola o émbolo que regula la presión con la ayuda de un resorte. El resorte está calibrado de tal forma que el émbolo se levante de su asiento cuando la presión de aceite llega al nivel deseado. Una vez que la válvula está abierta, la presión permanece bastante constante con sólo cambios ligeros que se presentan cuando varía la velocidad del motor.

El filtro y los otros componentes en el sistema de lubricación están sujetos a la presión establecida por la válvula reguladora. Si ésta presión es excesiva, se presentará el daño del filtro. Esto es lo que no comprenden las personas que no están familiarizadas con los sistemas de lubricación.

¿Qué es lo que puede hacer que la presión en el sistema exceda el ajuste de la válvula reguladora? La pregunta es que la válvula puede estar pegada en la posición cerrada o esta lenta para moverse a la posición abierta después de haber arrancado al motor. La figura 2 muestra el sistema funcionando con la válvula reguladora pegada en la posición de cierre. Bajo estas condiciones, la presión se acumula igualmente en todos los componentes en el sistema hasta que algo suceda para aliviar la presión. Si la válvula reguladora se despegas, la presión regresará a normal. Si permanece pegada, algo se tiene que romper.

La presión de operación normal no origina deformación permanente en el cuerpo del filtro. Cuando la presión del sistema llega a 150 PSI debido a una válvula reguladora defectuosa, la mayoría de los filtros se deforman permanentemente. A esta presión, la junta generalmente no se romperá y la costura engargolada permanecerá intacta.

Si la válvula reguladora continúa pegada, la presión se incrementará más y la junta entre el filtro y la base puede romperse. Esto probablemente hará que se pierda todo el aceite en el sistema. Si el filtro se ha instalado de manera demasiado apretada, la junta no se romperá y la costura engargolada se desenrollará conforme la presión continúa aumentando.

Si el cliente está alerta y para el motor a la primera indicación de problema (lámpara roja en o reducción en la presión de aceite) él puede limitar su pérdida a un trabajo de arrastre, cambio de aceite y filtro nuevo.

Si conduce hasta el taller más próximo, probablemente quemará el motor debido a la falta de aceite. El punto principal es que el filtro deformado no es la causa de esta presión excesiva, sino que es la víctima de una válvula reguladora defectuosa.

Todos los fabricantes de filtros han recibido alguna vez un filtro. El cliente preguntará si un filtro que haya estado completamente tapado podría haber causado las condiciones de sobrepresión en el sistema. La respuesta es no. Si la válvula reguladora está funcionando correctamente mantendrá la presión en el filtro a 40 o 60 PSI incluso si el filtro está tapado.

Resumiendo, si un filtro se deforma debido a sobre presión en el sistema, la falla reside en la válvula reguladora y no en el filtro.

Fig. 2

Filtros con soporte central o elemento colapsado.

COLAPSO:

Término usado para describir el daño ocasionado a un filtro en cuya apariencia se observa un aplastamiento del soporte central para el medio filtrante (figura 1).

Cuando encontramos un elemento filtrante donde ha ocurrido un colapso, la tendencia natural, es pensar que algo dentro del filtro no funcionó de manera correcta, siendo éste, el causante de los daños ocasionados. Generalmente esta no es la causa de los daños, sino el síntoma de un problema dentro del motor.

Los motores automotrices incorporan una válvula check o válvula de alivio entre la entrada y salida del flujo total de aceite, esta válvula permite la continuidad de la lubricación creando un by-pass por donde el aceite circula sin pasar por el filtro directamente dentro del motor cuando existe una restricción significativa en la presión de aceite, debido a la saturación del filtro o al arranque en frío (figura 2).

Generalmente los fabricantes de motores automotrices, han diseñado estas válvulas de alivio para abrir cuando la presión diferencial excede las 10 PSI, otros utilizan presiones de hasta por 30 PSI. Así algunos fabricantes de motores diseñan esta válvula integrada en el monoblock, mientras que otros prefieren que sea el filtro el que la lleve.

Los filtros automotrices han sido diseñados para soportar presiones significativamente superiores a la presión de operación normal de trabajo sin colapsarse, de ahí que cuando un filtro sufre un colapso, generalmente es el resultado de una obstrucción o de un mal funcionamiento de la válvula de alivio.

En ocasiones no es suficiente la obstrucción de la válvula para colapsar el filtro. La válvula reguladora de presión también puede obstruirse dando como resultado un incremento de presión en el flujo a través del filtro, aunque esta condición puede ser momentánea, rápidamente puede colapsarse el filtro si la válvula de alivio no puede liberar la presión excedente, debido al cambio repentino y por arriba de la presión de operación normal de trabajo.

Un filtro colapsado puede ocasionar la pérdida de la filtración y lubricación del motor, si esta condición se presenta, las válvulas reguladoras de presión y de alivio deberán ser inspeccionadas y reparadas o sustituidas por nuevas tan pronto como sea posible, previniendo de esta manera se presenten daños mayores.

El mal funcionamiento de la válvula de alivio y la válvula reguladora de presión y el subsiguiente colapso del filtro, puede no causar daños notables en el motor, pero en ocasiones tiene resultados catastróficos, llegando a producir serios sobrecalentamientos e inclusive desvielmientos por falta de una lubricación.

Las causas frecuentes que producen el mal funcionamiento tanto de la válvula reguladora de presión como de la válvula de alivio pueden ser:

- 1.- Superficies pegajosas causadas por el arranque en frío o por el uso de aceites altamente viscosos.
 - 2.- Aceites excesivamente contaminados asociados a la condensación, mezcla de refrigerantes y la oxidación del propio aceite.
 - 3.- Descuido del usuario al prolongar los intervalos para el cambio de aceite y filtros recomendados por el fabricante.
 - 4.- Residuos de carbón arenoso que temporalmente atascan el libre movimiento de los componentes de la válvula.
 - 5.- Repentinos cambios de aceleración con la presencia de cualquiera de las condiciones arriba mencionadas.
 - 6.- La combinación de cualquiera de las causas anteriores.
- Descubrir un filtro colapsado, es un llamado para inspeccionar el estado de las válvulas de alivio y reguladora de presión en el motor. Así como revisar el funcionamiento del motor y la ejecución de los programas de mantenimiento.

GARANTIA

Los filtros GC están garantizados contra defectos de diseño, materiales y mano de obra. Estos filtros cumplen con los requerimientos especificados por los fabricantes, del motor y del vehículo.

WARRANTY: GC filters are warranted against defect in design, materials and workmanship. They comply with the requirements specified by vehicle and engine manufacturers.
